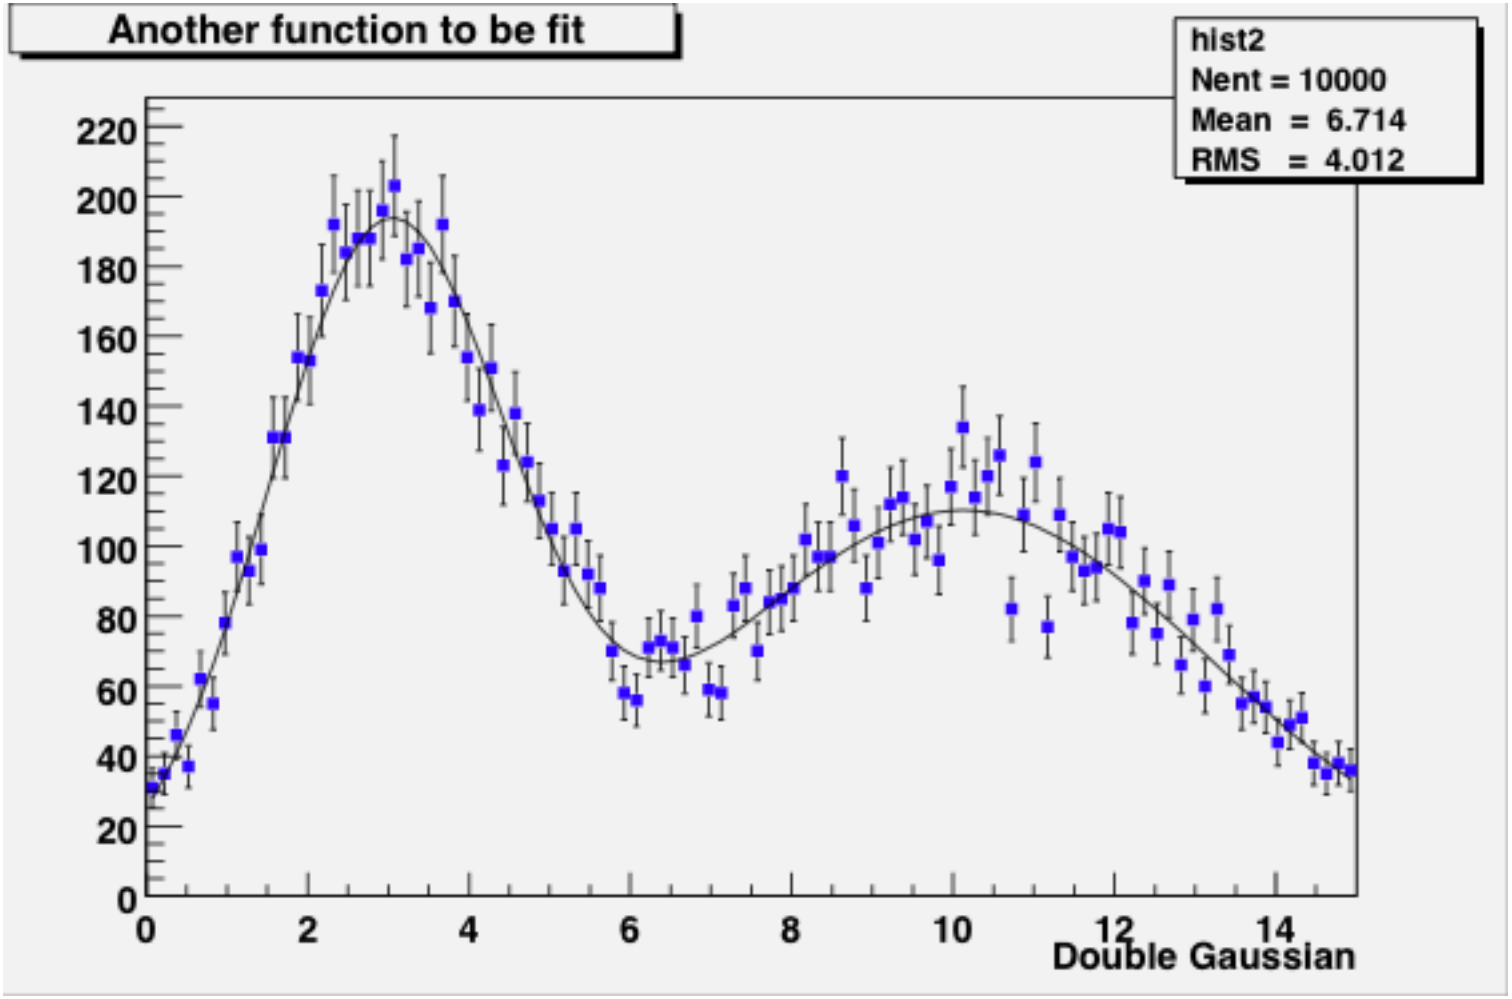
What is ROOT?
Why do we use it?

Answer:

ROOT does what physicists do:

It makes plots.



Another function to be fit
hist2
Nent = 10000
Mean = 6.714
RMS = 4.012

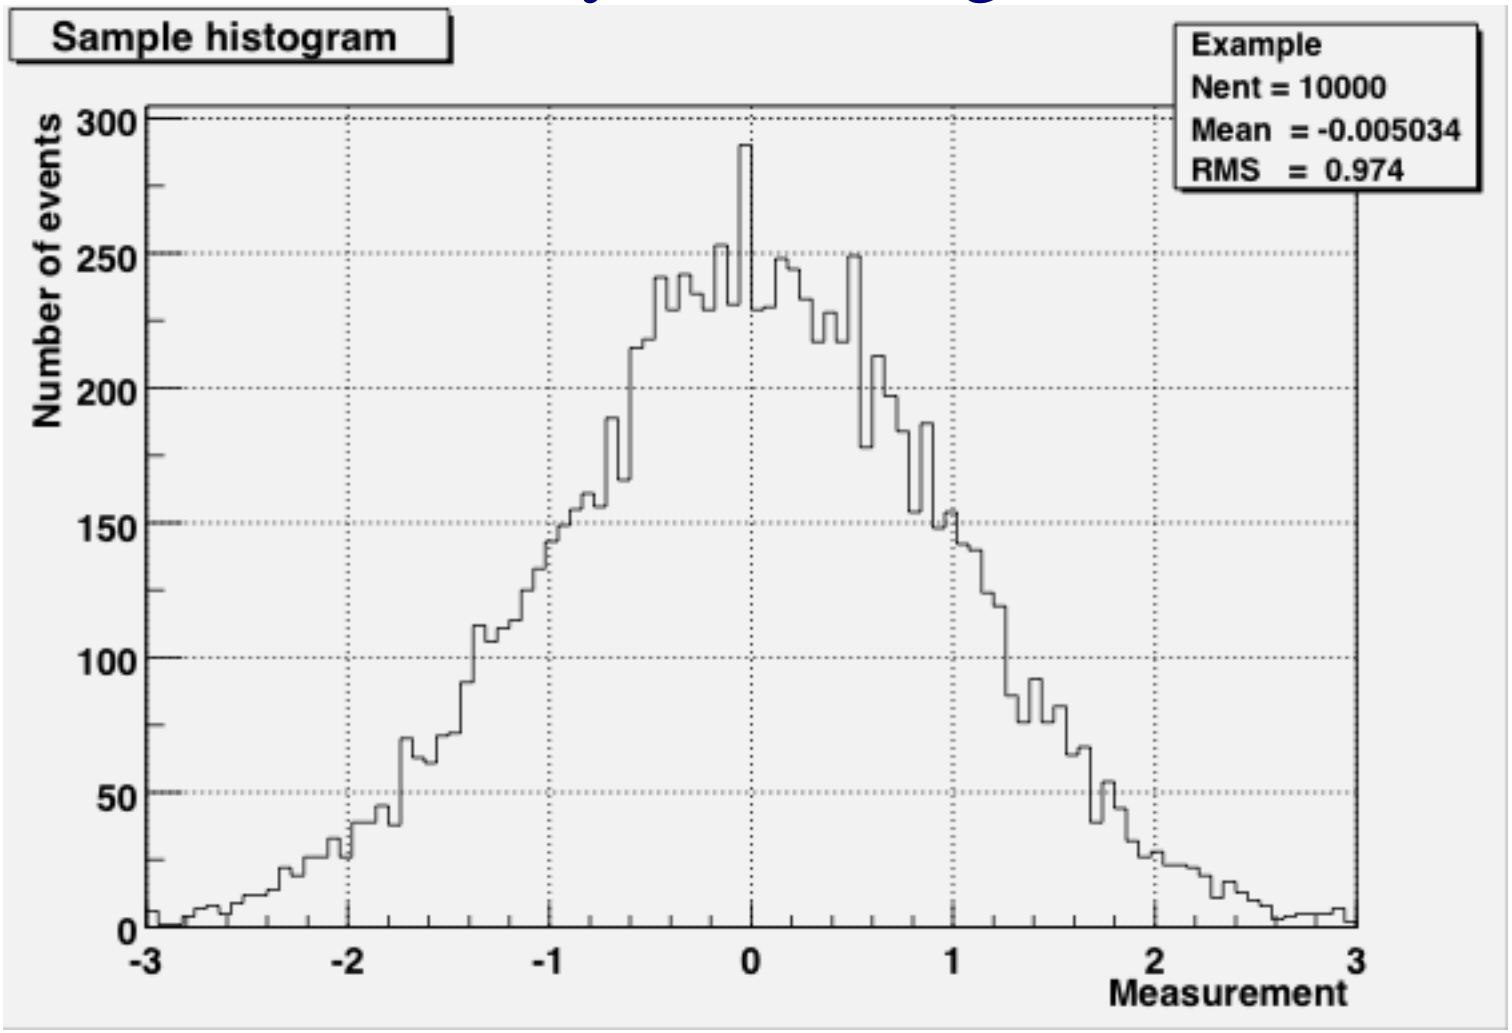
Can you spot the pun in this plot?

The typical analysis task that you will be asked to do:

Take variables in an n-tuple, perform some computations, and make histograms.

So what is a histogram, what is an n-tuple, and how do we perform the computations?

Anatomy of a histogram

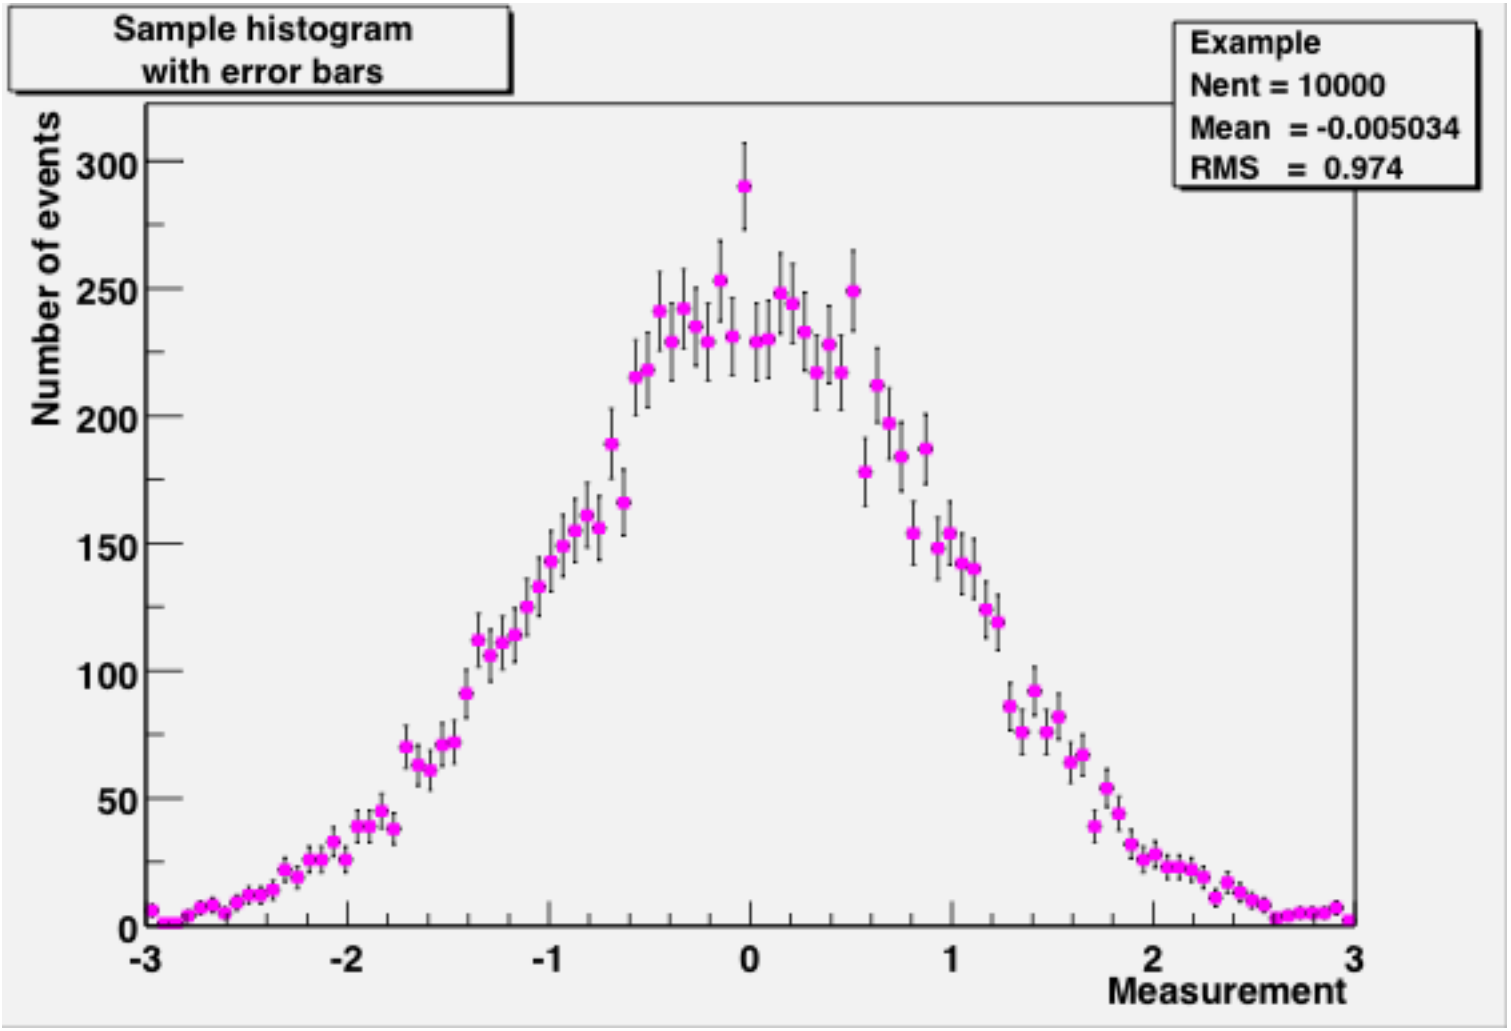


Properties of a histogram

- Name or Identifier
- Title (to be displayed on plot)
- Number of bins
- Lower bin limit
- Upper bin limit

A ROOT command that might be used to define this histogram:

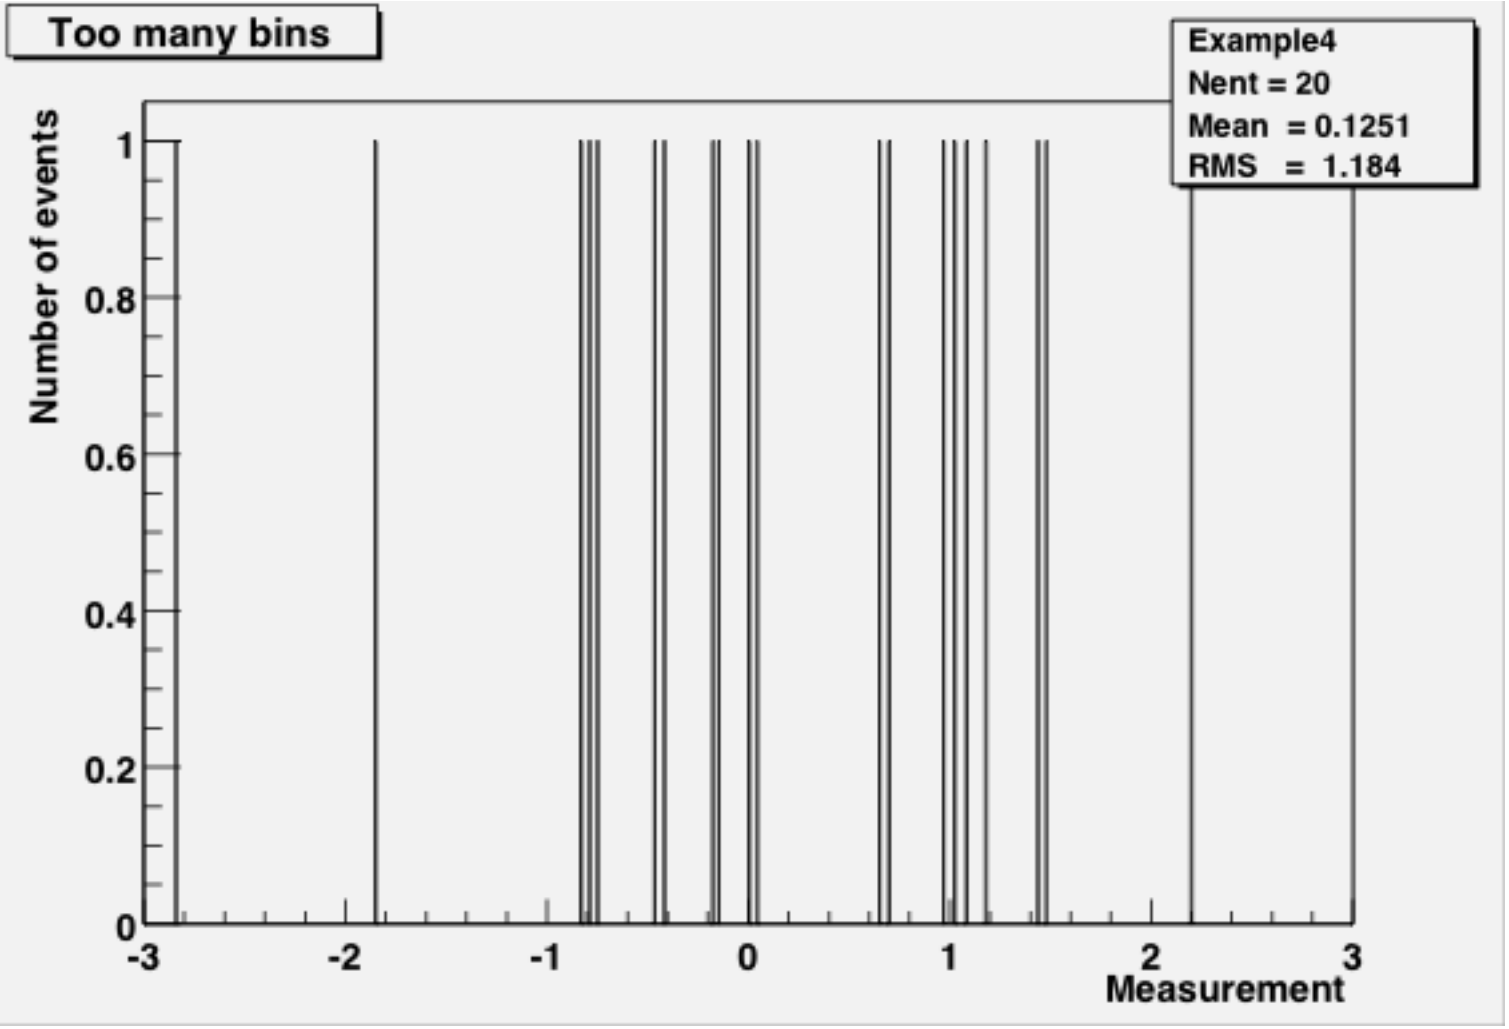
```
TH1F myPlot("Example","Sample histogram",100,-3,3)
```

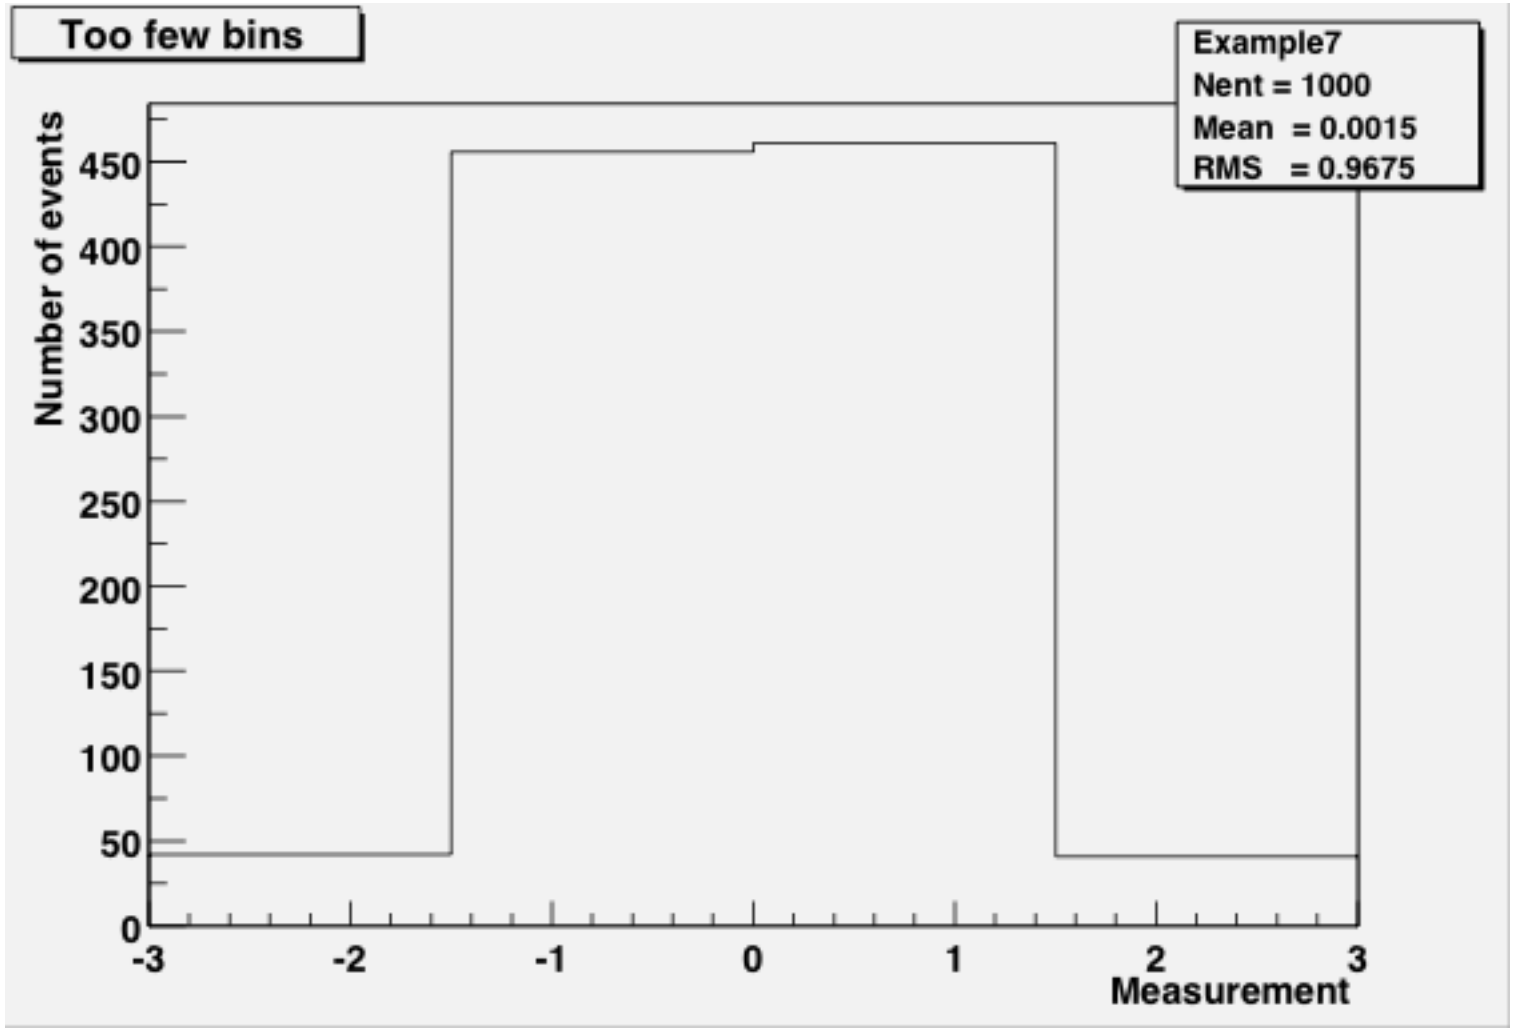


Don't forget the errors!

For simple histograms, the error in one bin is the square root of the number of events in that bin.

There's an art to histogram design...





Too few bins

Measurement

Anatomy of an n-tuple (a simple form of a ROOT Tree)

Branches -->

<-- Entries

Row	event	ebeam	px	py	pz
0	0	150.14	14.33	-4.02	143.54
1	1	149.79	0.05	-1.37	148.60
2	2	150.16	4.01	3.89	145.69
3	3	150.14	1.46	4.66	146.71
4	4	149.94	-10.34	11.07	148.33
5	5	150.18	17.08	-12.14	143.10
6	6	150.02	5.19	7.79	148.59
7	7	150.05	7.55	-7.43	144.45
8	8	150.07	0.23	-0.02	147.78
9	9	149.96	1.21	7.27	146.99
10	10	149.92	5.35	3.98	140.70
11	11	149.88	-4.63	-0.08	147.91

An n-tuple is an ordered list of numbers.

A ROOT Tree can be an ordered list of any collections of C++ objects.

Probably you'll only be asked to work with n-tuples this summer, but in the advanced tutorial you can see what it's like to work with a ROOT Tree.

Why ROOT?

- It knows about n-tuples and histograms
  (and 4-vectors and object persistency and schema evolution
  and detector geometry and Feynmann diagrams
  and linear algebra and function-fitting and multi-variable analysis and…)
- It can handle large volumes of data
  (millions of physics events; files of gigabytes->terabytes in size, multi-threaded and batch processing).
- Multi-platform (Windows, Mac, many UNIX flavors)
- It's free.

But...

- It's open-source, with a complicated design history.
- User-interface issues and documentation are often neglected. It's not a pre-packaged "app." ROOT is not easy to use.
- You have to know some C++ in order to use ROOT effectively, in order to perform computations.
- What does C++ look like? Well...

```
#define AnalyzeHistogram_cxx

#include "AnalyzeHistogram.h"
#include <TH2.h>
#include <TStyle.h>

//******** Definition section *********
TH1* chi2Hist = 0;

void AnalyzeHistogram::Begin(TTree * /*tree*/)
{
  TString option = GetOption();

  //******** Initialization section *********
  chi2Hist = new TH1F("chi2","Histogram of Chi2",100,0,20);
  chi2Hist->GetXaxis()->SetTitle("chi2");
  chi2Hist->GetYaxis()->SetTitle("number of events");
}

void AnalyzeHistogram::SlaveBegin(TTree * /*tree*/)
{
  TString option = GetOption();
}

Bool_t AnalyzeHistogram::Process(Long64_t entry)
{
  //******** Loop section *********
  tree1->GetEntry(entry);
  chi2Hist->Fill(chi2);

  return kTRUE;
}

void AnalyzeHistogram::SlaveTerminate()
{}

void AnalyzeHistogram::Terminate()
{
  //******** Wrap-up section *********
  chi2Hist->Draw();
}
```

If you prefer python, there's pyroot

```
import ROOT

# Open the file.
myfile = ROOT.TFile( 'experiment.root' )

# Retrieve the n-tuple of interest.
mychain = ROOT.gDirectory.Get( 'tree1' )
entries = mychain.GetEntriesFast()

# Create a 2D histogram
myHist = ROOT.TH2D("hist2D","chi2 vs ebeam",100,0,20,100,149,151)
myHist.GetXaxis().SetTitle("chi2")
myHist.GetYaxis().SetTitle("ebeam [GeV]")

for jentry in xrange( entries ):

   # Copy next entry into memory and verify.
   nb = mychain.GetEntry( jentry )
   if nb <= 0:
      continue

   # Fetch the variables from the entry and fill the histogram.
   chi2 = mychain.chi2
   ebeam = mychain.ebeam
   myHist.Fill(chi2,ebeam)

# Display the scatterplot.
myHist.Draw()
```

Web Links

(the only part you should bother to write down)

All the documents you've seen (and will see) during the class today and tomorrow can be found at:

http://www.nevis.columbia.edu/~seligman/root-class/

ROOT and C++ links, including links to reference books on C++ and statistics, can be found at:

http://www.nevis.columbia.edu/~seligman/root-class/links.html

The Hands-on Course:

Basic Data Analysis using ROOT

ROOT basics

Over the next two days, you will learn how to:

- look up ROOT command references
- plot a function
- histogram a variable
- fit a histogram
- get a variable from an n-tuple
- apply cuts
- do a quick study using TreeViewer (optional)
- create C++ or python code for an n-tuple

-- but not necessarily in this order!

The advanced tutorial (which you may not get to) includes sets of additional exercises to help turn you into a ROOT expert:

- Creating an x-y plot
- Working with large numbers of histograms
- Extracting your own n-tuples

A Brief ROOT Demonstration
